## Main ocean parameters measured from space:

- Sea surface temperature : Onboard radiometers (passive micro-waves)
- Sea surface salinity : Radiometry/active micro-waves
- Ocean surface topography (*currents; tides, sea level*) : Satellite altimetry
- Surface winds : Active microwaves (radar altimetry/scatterometry)
- Wave height: Altimetry; radar imagery
- Ocean mass: Space gravimetry (GRACE)
- Ocean color (*phytoplankton* → *marine ecosystems*): Multispectral imagery

# Sea Surface Temperature (Polar orbiting)

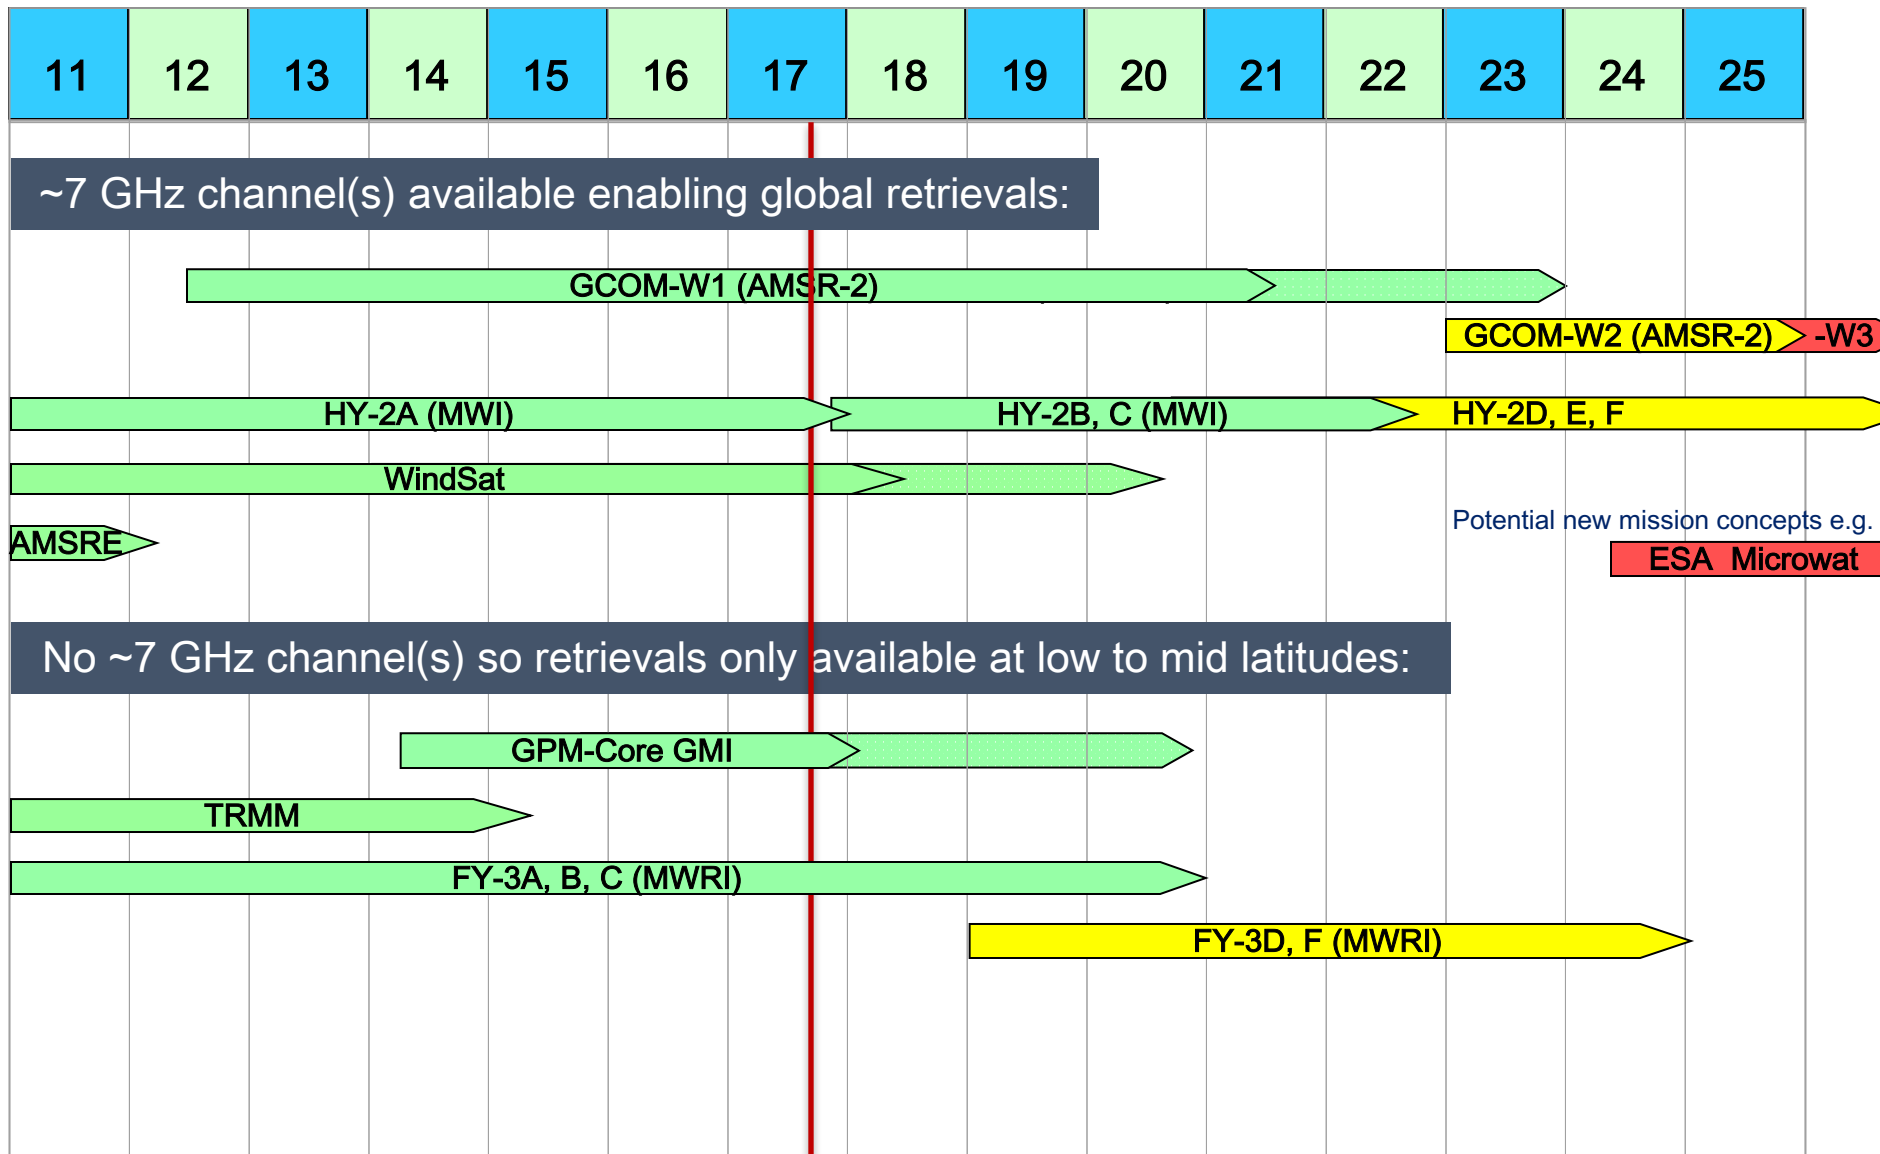

# Sea Surface Temperature (Geostationary)

# Passive Microwave Radiometers for SST

In orbit

Approved

Planned/Pending approval

SMOS  
Launched Nov. 2009

The image shows the SMOS (Soil Moisture Ocean Salinity) satellite in orbit above Earth. The satellite is a yellow and white structure with several solar panel arrays extending from its main body. The Earth's surface is visible below, showing blue oceans and white clouds.

Aquarius  
June 2011-June 2015

The image shows the Aquarius satellite in orbit above Earth. It features a large, circular, gold-colored parabolic antenna dish. The satellite body is white and gold, with various instruments and solar panels visible. The Earth's surface is seen below.

The three L-band ( $\sim 1.4$  GHz) satellite missions that have pioneered salinity measurements from space

SMAP  
Launched Jan. 2015

The image shows the SMAP (Soil Moisture Active Passive) satellite in orbit above Earth. It has a large, green, circular antenna dish. The satellite is white and gold, with a solar panel array. The Earth's surface is visible below.

# Salinity from space using L-band radiometry

## SMOS

Soil Moisture and Ocean Salinity

ESA Earth Observer (CNES PROTEUS platform)

The first Interferometer for earth observation!

**Aquarius**  
Argentina-USA collaboration (CONAE/NASA)

3 radiometers in the L-Band + 1 scatterometer

## SMAP

Soil Moisture Active Passive  
Built at JPL

L- Band radiometer

# SMAP

## Soil Moisture Active Passive

- Polar Orbit @ altitude: 685 km.
- 8-day repeat.
- Local ascending/descending time: 6 PM/AM.
- Frequency 1.41 GHz.

- Full 360° scan views the Earth.
- 1000 km wide swath.
- 3-dB (half power) footprint size: 40 km.
- Time for sampling 1 footprint: 17 msec.

**Aquarius** and **SMAP** have both about the same instrument noise.

The **Aquarius** data are pre-averaged during L1/L2 processing. The **SMAP** data do not.

Noise figures @ L2: **Aquarius**  $\approx$  0.4 psu. **SMAP**  $\approx$  1.0 psu.

# New CATDS SMOS SSS in very good agreement with SMAP data in river plumes

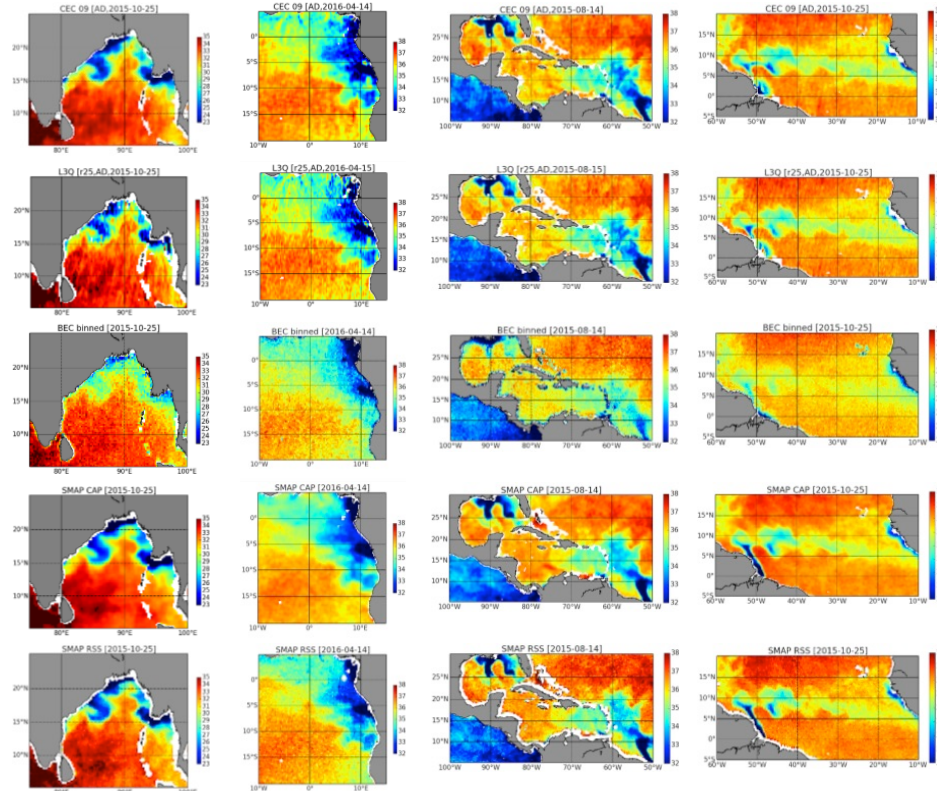

SMOS CATDS CEC LOCEAN  
Debias\_v2

SMOS CATDS CPDC L3Q  
Binned - near-real time

SMOS BEC non bayesian  
binned

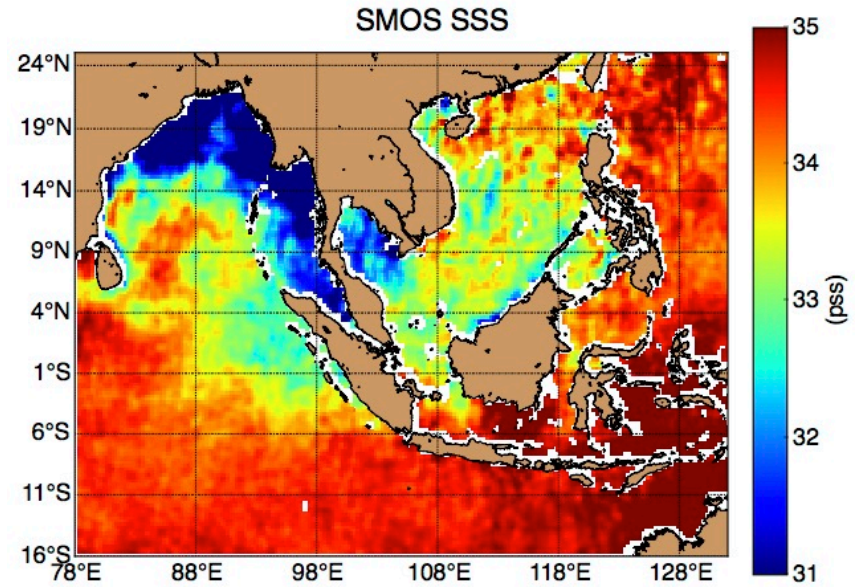

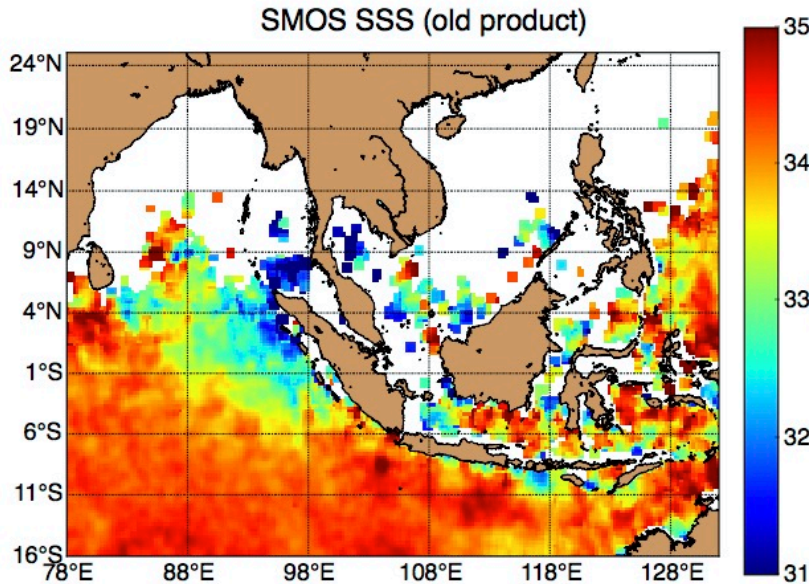

SMAP CAP/JPL

SMAP RemSS

*Boutin et al., subm. RSE, 2017*

# Comparison of SSS, Nov. 2015 example: SMOS-old, SMOS-new, and SMAP

New SMOS SSS product in 2017 (CATDS, Boutin et al. 2017, RSE, submitted) brought significant improvements in marginal seas & coastal oceans.

New SMOS SSS very consistent with SMAP SSS in the Bay of Bengal.

Application example: Tuesday poster by Severine Fournier

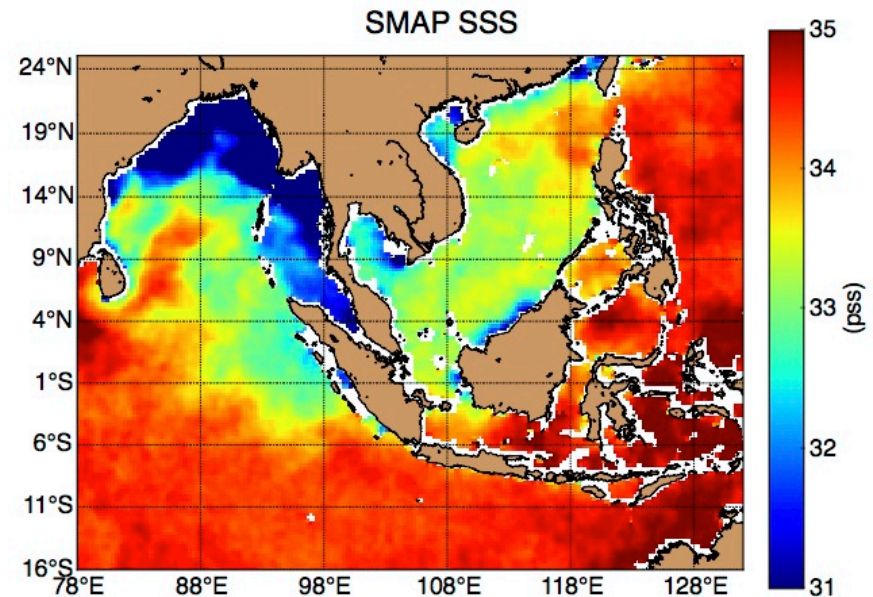

Image credit: Severine Fournier

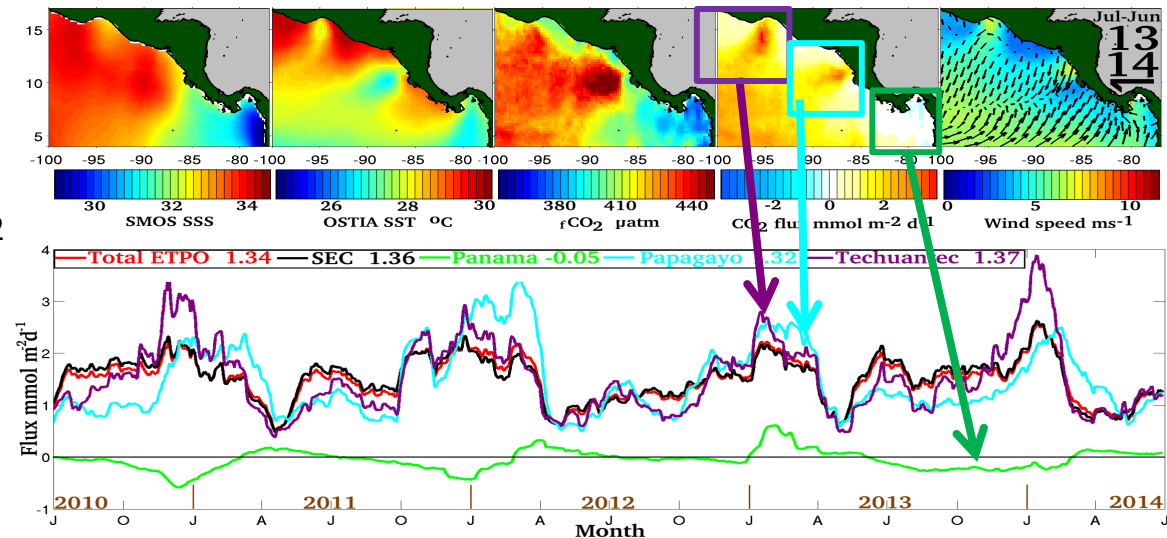

# New insights of pCO<sub>2</sub> variability in the tropical eastern Pacific Ocean using SMOS Salinity

C W Brown, J Boutin, L Merlivat, LOCEAN Paris

A quantitative analysis of the opposite effects of **local upwellings and rainfall** on the variability of surface ocean CO<sub>2</sub> partial pressure and of the **air-sea CO<sub>2</sub> flux**.

The synergistic use of SMOS SSS, together with satellite SST, precipitation and wind allows the first spatio-temporal mapping of pCO<sub>2</sub> in certain dynamic regions and to distinguish atmospheric CO<sub>2</sub> signatures from subsurface injection at the surface (here the coastal upwellings along the Pacific coasts of central America)

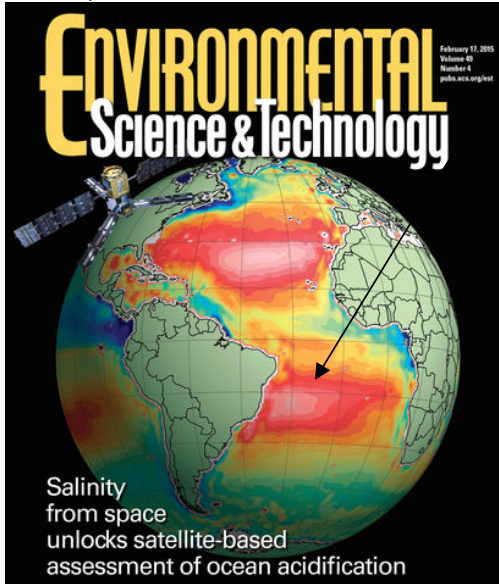

Brown et al. Biogeoscience, 2016

# Biogeo-chimie à partir de la SSS SMOS data: cycle des carbonates

Spaceborne data estimation of alkalinity:

Land et al., *Environmental Science & Technology*, 2015

50-100 km/weekly to monthly

Accuracy of  $\pm 0.2$  pss SSS  $\leftrightarrow$   $\pm 10-15 \mu\text{mol}^{-1} A_T$

SMOS data allows a global monitoring of  $A_T$

Particularly in intense mixing zones (river plumes, current fronts)

❑ First Estimation of **Total Alkalinity  $A_T$**  of surface water from spaceborne measurements of SSS & SST:

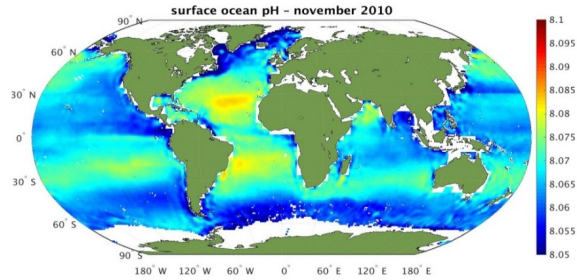

❑  $A_T = \text{Funct}(\text{SSS}, \text{SST})$  (lee et al 2006)  
SSS, SST = SMOS CATDS, GHR SST

❑  $A_T$  little impacted by biological processes

❑  $A_T$  strongly correlated with SSS

❑ First-ever estimates of EO-based **global surface ocean pH** using **SMOS SSS, satellite SST & ocean color**

❑ Help defining future mission concepts to monitor ocean acidification

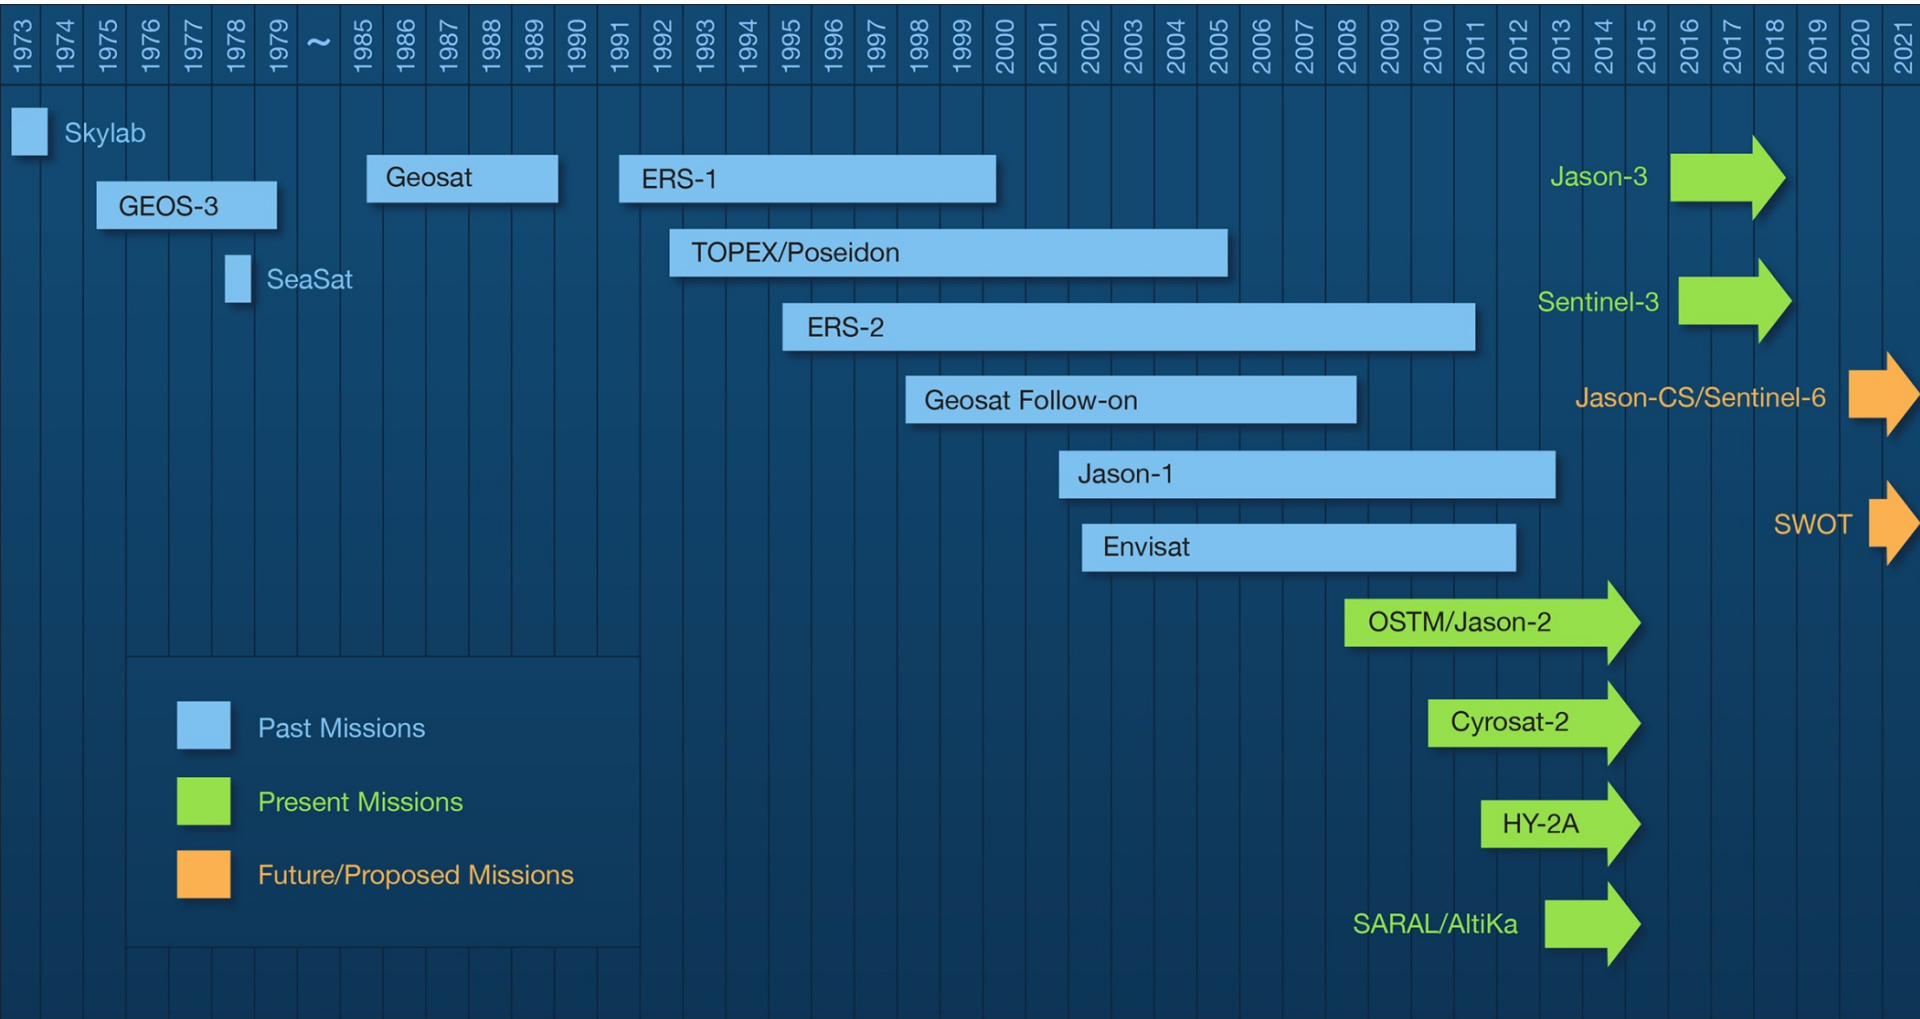

First-ever estimates of EO-based global surface ocean pH. (credits: ESA/R. Sabia)

# Altimetry Missions (1973-2017)

# SWOT MISSION

Launch Date: April, 2021

# SWOT Mission description

## Mission Architecture

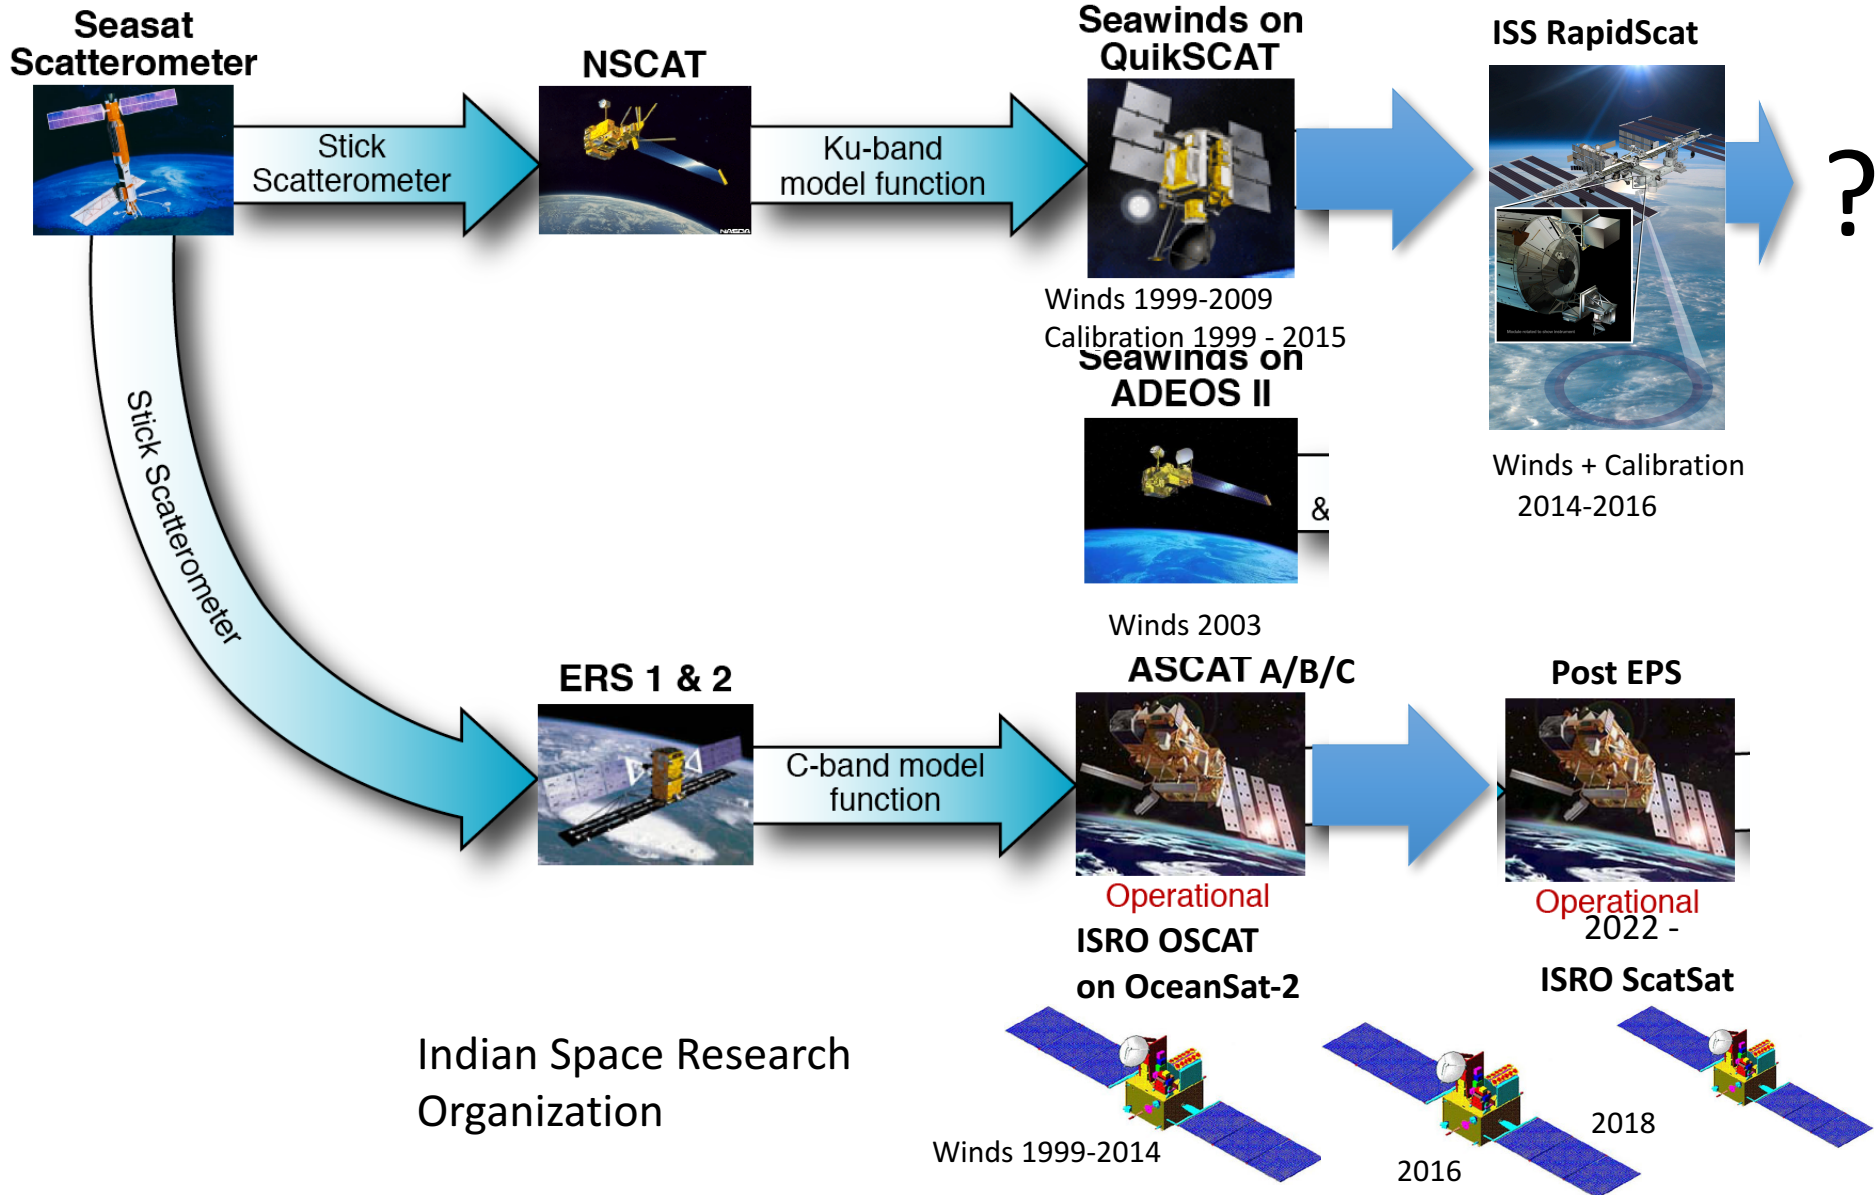

- Ka-band SAR interferometric (KaRIn) system with 2 swaths, 50-60 km each
- Produces heights and co-registered all-weather imagery
- Intrinsic resolution 2 m x 10-70 m grid
- Use conventional Jason-class altimeter for nadir coverage, radiometer for wet-tropospheric delay, and GPS/Doris/LRA for POD.

- Partnered mission NASA, CNES & CSA
- Mission life of 3 years
- 873 km Orbit, 78° Inclination, 22 day repeat
- Launch: 2020

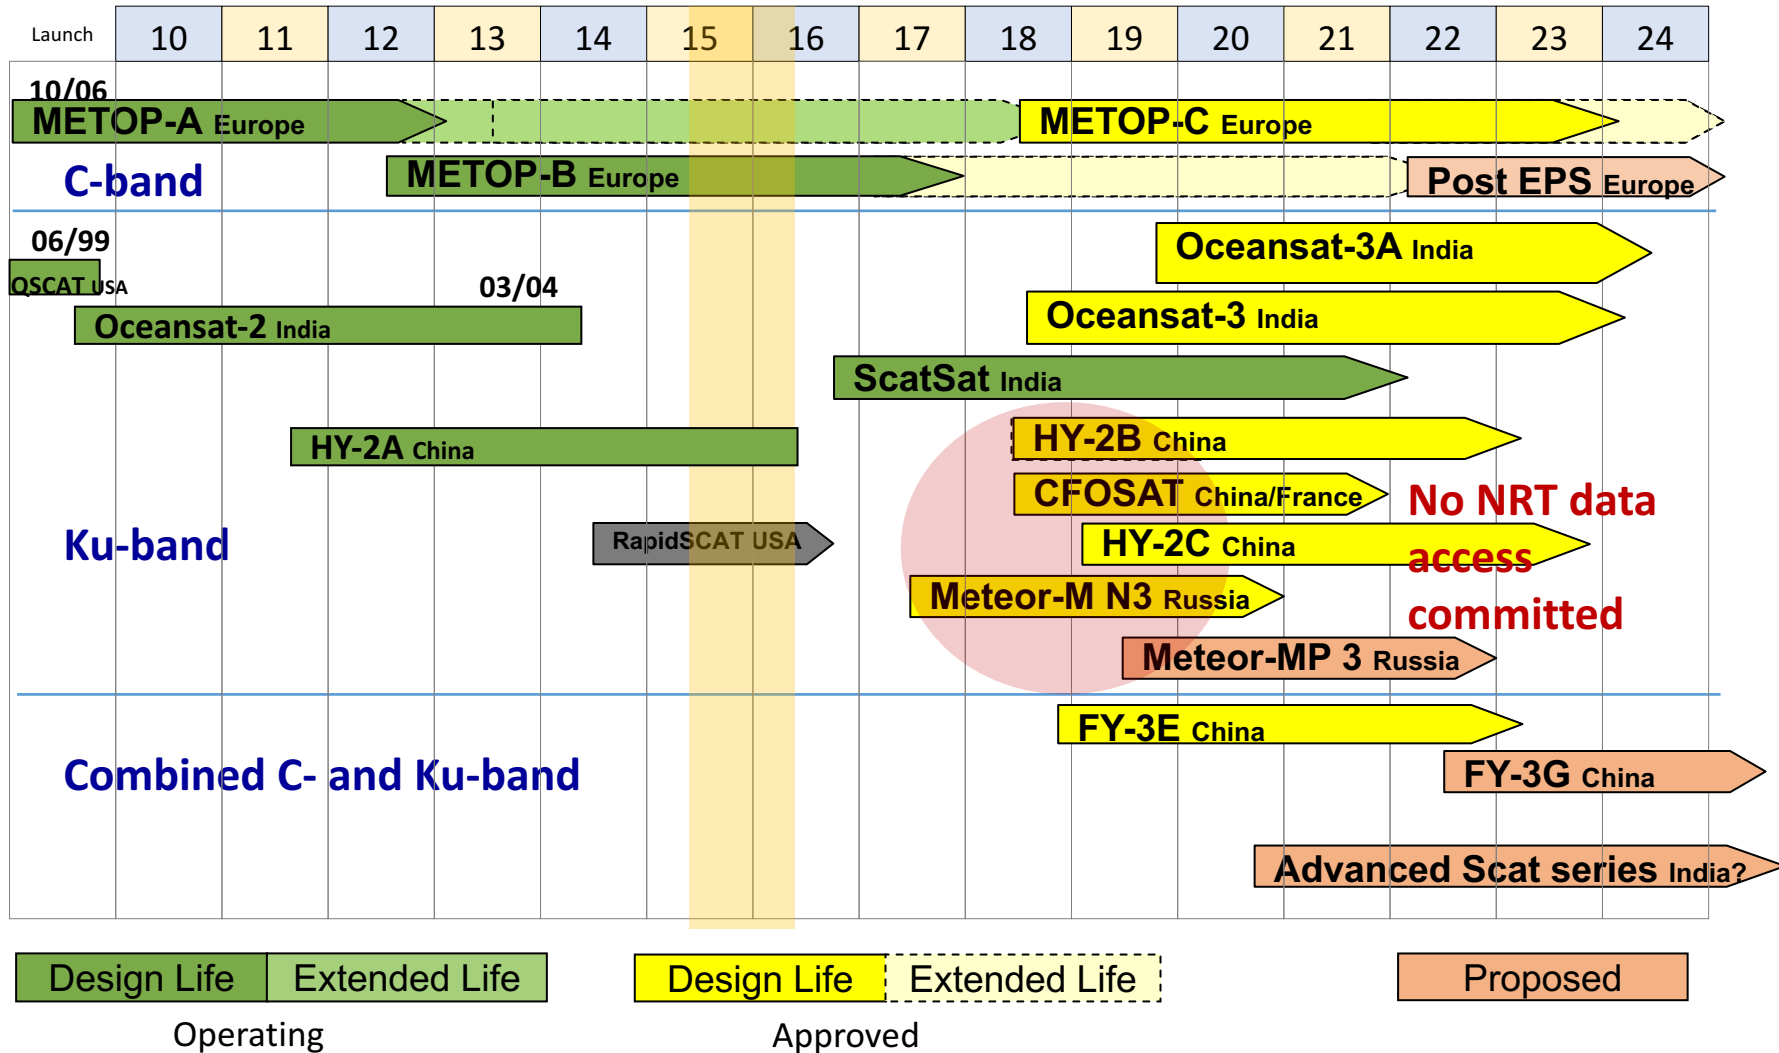

# Scatterometer Constellation Evolution

Design Life	Extended Life	Design Life	Extended Life	Proposed
Operating		Approved		

Source: WMO OSCAR database and direct interactions with agencies

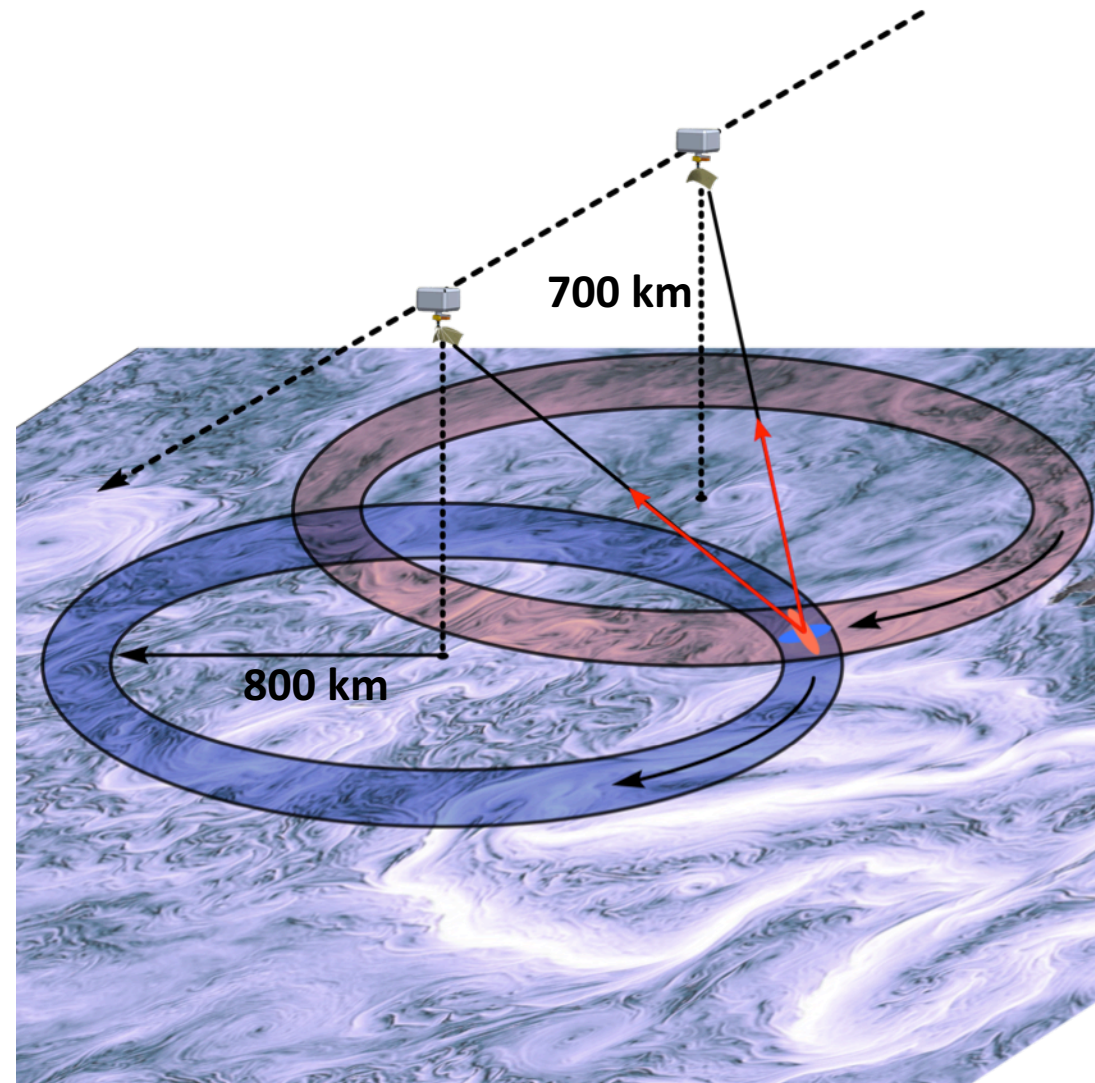

# New Concept: Simultaneous Wind and Surface Currents

- Surface currents are poorest observed ocean surface variable
- Surface currents play important roles in coupling the atmosphere and the ocean, and are different from geostrophic currents in critical ways
- Key outstanding questions
  - How do currents modify air/sea coupling (in a two-way coupled sense)?
  - How are winds and surface currents coupled?
  - How great is the equatorial upwelling, and what is the wind-induced variability?
  - How do winds and currents move fresh water Arctic and Nordic Seas?
- Applications:
  - Debris transport, nutrient transport and primary productivity, iceberg transport and primary productivity, ice motion, seasonal to interseasonal forecasting, ocean forecasting and more

# Doppler Scatterometer Measurement Concept

- Ka-band rotating pencil beam Doppler scatterometer
- Ku-band rotating beam scatterometer
- Winds measured from Ka/Ku  $\sigma_0$  measurements at multiple azimuth angles
  - Heritage: QuikSCAT, RapidScat, OSCAT
- Surface currents from Doppler measurements at multiple azimuth angles
  - Heritage: SAR Doppler, Along-track interferometry, field tested
- Temporal coverage achieved by 1600 km swath

# Summary

- SST: The biggest issue right now will be a lack of future microwave missions.
  - AVHRR -19 (NOAA 19) could very well be the last US polar orbiter. The Pathfinder SST data set which is the longest satellite derived climate data record has been discontinued.
- SSH: Jason-3 is the only altimeter from NASA onboard.
  - SWOT is scheduled for 2021.
- Salinity: Aquarius version 5 will come out late 2017. SMAP salinity.
  - No future salinity mission or follow-on to Aquarius
- Winds: Lack of Scattermeters.
  - No future Scatterometer missions planned by NASA
  - IOVWST supports the Doppler Scatterometer mission concept.
- Ocean color: Many ocean color sensors are launched and also scheduled for launch by many countries
  - PACE is scheduled to launch in 2022/23
